

WHAT IS IPÉ

Ipé is a hardwood from Brazilian rainforests that has received lots of attention in the past couple of decades. Why? For one thing, it's as hard—or harder—than nails (it's been known to bend nails). Ipé is so dense that it often needs to be pre-drilled before pieces are connected. Some compare its strength to that of steel.

Similar in appearance to mahogany, Ipé is also popular for its durability and beauty as a warm, rich, hardwood. It's a smart choice that is becoming more popular in outdoor applications such as decking and patio furniture. Bought from a reliable source, Ipé is often FSC certified, which makes it an environmental choice for your outdoor living space.

Other attributes of Ipé wood include:

- It can last more than 25 years outdoors
- Eco-friendly; 100 percent natural wood
- Mold, fire, weather, and pest-resistant
- Resists surface scratches
- Three times harder than cedar
- One of the densest hardwoods, it sinks in water
- It has the same fire rating as steel and concrete, making it a more fire-resistant choice than softwoods
- Has high concentrations of tannic acid, which makes it resistant to rot, insects, and fungi. Because of this, stainless fasteners are recommended
- Quite simply, Brazilian Ipé looks good just about anywhere outdoors

DURABLE

THE CONEY ISLAND CONNECTION

Over 40 years in application!

Some of the wood along Coney Island's boardwalk in New York was made of Ipé, which is a testament to its longevity. Residents protested in 2015 when part of the boardwalk was set to be replaced by recycled plastic lumber and concrete.
